The great steel dry dock Dewey, which is expected to be completed by the end of the year, is one of the greatest structures to be built in the United States, and when it is finished it will be one of the most powerful naval basins which has ever been constructed. It is being built at the New York Bureau of Construction and is designed to be the largest and most complete dry dock in the world.

In its present form, the dry dock will be 1,300 feet long, 150 feet wide, and 75 feet deep. It will be able to accommodate the largest battleships and other vessels now in commission. The walls of the dock will be constructed of steel and reinforced concrete, and the floor will be covered with a layer of asphalt to prevent the entry of water.

The dry dock will be equipped with powerful hoisting and launching apparatus, which will enable vessels to be raised or lowered with ease. The dock will also have a large area of land inside it, which will be used for dry docking, repairs, and other purposes.

In addition, the dry dock will be equipped with electric power, which will be used for lighting, heating, and other purposes. The dock will also have a large area of land inside it, which will be used for dry docking, repairs, and other purposes.

The construction of the dry dock is expected to be completed by the end of the year, and it will be one of the most important accomplishments of the Bureau of Construction.
