The First of Our Battle Cruisers a Vitally Necessary Addition to the U.S. Navy.

SEEKING TO FIX THE NORMAL DURATION OF HUMAN LIFE

By S. L. SANCHEZ, M.D.

The time at our disposal, referred to as the natural span of man's life, is a question of vital importance to all classes of society. Dr. SANCHEZ, in his book, "The Normal Duration of Life," discusses the subject in detail.

The period of development is the time during which the individual is in the most active state of life. During this period, the individual is able to perform the tasks required of him. The period of reproduction is the time during which the individual is capable of producing offspring. During this period, the individual's physical and mental capacities are at their peak.

The period of regeneration is the time during which the individual's body is able to repair itself. During this period, the individual's body is able to adapt to new situations and to overcome new challenges.

The period of retirement is the time during which the individual is no longer able to perform the tasks required of him. During this period, the individual's physical and mental capacities are at their lowest level.

The period of death is the time during which the individual's body ceases to function. During this period, the individual's body is unable to repair itself and is unable to adapt to new situations.

In the case of those who have been in good health, the period of reproduction is the longest period of life. In the case of those who have been in poor health, the period of death is the longest period of life.
